To Whom It May Concern,

I am a software engineer who combines creativity with pragmatism. I think outside of the box but within the confines of the problem. I have experience in designing, planning and implementing technical solutions to a variety of complex problems at different scales and with diverse technologies.

I am an eager learner, always excited to plunge into a new framework or design pattern, happy to rework and optimize old code. I take pleasure in doing a task well, writing code I can be proud of. People know me as a solution architect, both an idea generator and a problem solver, zooming in and out between big picture and technical details.

In my current role, I have coordinated cross-team and cross-discipline optimizations, reducing average database computation time by over 40% and time to first meaningful paint by more than 3 seconds. At the same time, I have been managing the team in charge of genetic reports, the company's core product, together with over ten other microservices. In my time as manager, I have designed and spearheaded the highest priority features, including developing three new report types, the ability to share profiles and a platform for pro users.

I mean to undertake any position with an analytic and reflective mindset and an unwavering commitment to self-improvement. Thank you for your time and consideration.

Yours sincerely,

Christopher Huber
